

- The element created from scratch was the banner for the top of the page.
- Embedded media was used in the video console for the media section to display YouTube videos.
- The secondary navigation system is an aside to the left of the Media Hub page and the Design page.
- The image on the site that utilizes the CSS rollover effect is the picture of the PCB layout in the tutorial for prototyping a boost converter.
- JavaScript was used in the footer to provide the last time and day the page was modified.
- A-level work was done on the 'Design' section of the website. I added a great deal of detail to the section. Also, the tutorial section in the media page was a cool touch.
- The 'resources' page could use some improvement in terms of layout. Right now it is just a bunch of links. Maybe laying them out so that it is not just a wall of text would remedy that.
- Print CSS was implemented as an extra.
- Photos were reduced to much smaller sizes using Irfanview while retaining decent image quality.
